The descriptors or categories assigned to entries in an information system form the basis of most retrieval mechanisms (e.g., menu or key word). These descriptors are the primary means of communication between system designers and end users. In this paper we analyze some of the factors which influence this communication link. Our goal is to uncover some psychological principles that will help us to understand naming and describing behavior and thus improve the communication between designer ...

Susan T. Dumais, Thomas K. Landauer

December 1983 **Proceedings of the SIGCHI conference on Human Factors in Computing Systems**

Publisher: ACM Press

Full text available: pdf(330.01 KB)

Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

The successful use of menu-based information retrieval systems depends critically on users understanding the category names and partitions used by system designers. Some of the problems in this endeavor are psychological and have to do with naming large and ill-defined categories so that users can understand their contents, and effectively partitioning large sets of objects. Systems of interest (like home information systems) often consist of new and frequently changing content in large and ...
